PROFESSIONAL SUMMARY

Backend Engineer with 2+ years of experience designing REST APIs, working with relational databases (PostgreSQL, MySQL), and integrating third-party APIs and webhooks (Mono, Paystack, Deepgram) into production fintech and SaaS platforms. Built webhook-driven transaction sync pipelines, financial data models, and authentication systems using Node.js, TypeScript, NestJS, Express, and Prisma. Comfortable owning features end-to-end and collaborating across the stack in remote, fast-paced teams.

TECHNICAL SKILLS

Backend: Node.js, TypeScript, Express.js, NestJS, REST API Design, Webhooks, Authentication, Third-Party API Integrations

Databases & SQL: PostgreSQL, MySQL, SQL, MongoDB, Supabase, Prisma ORM, Relational Data Modelling

Integrations: Mono Transaction Metadata API, Paystack Webhooks, Deepgram Speech-to-Text API, LLM API Integration

Frontend: Next.js, React.js, TypeScript, JavaScript, Astro

Cloud / DevOps: Docker, Linux CLI, Git, GitHub, PNPM, Postman

Testing: Jest, Unit Testing, Integration Testing

PROFESSIONAL EXPERIENCE

Backend Engineer — Trackly

2025 – Present

- Architected a financial taxonomy system linking Transactions, Categories, and Groups, reducing manual categorisation effort by ~40% and establishing the data model for downstream reporting.
- Built and secured CRUD REST APIs with protected category logic, enforcing business rules across financial workflows and preventing invalid state changes in production.
- Engineered an automated transaction rules engine matching merchant names, amounts, and keywords to eliminate manual tagging for recurring transactions.
- Designed a PostgreSQL + Prisma many-to-many transaction tagging system for flexible, multi-dimensional categorisation without schema changes.
- Built real-time budget aggregation services powering live spending-analysis dashboards.
- Implemented transaction synchronisation via Mono webhooks, consuming real-time events from the Mono Transaction Metadata API to normalise financial records into Supabase and trigger automated sync on user login.

Backend Developer (Lead) — Sabiguy.com

2026 • Volunteer

- Led the backend architecture redesign of a 10,000+ line Node.js/MongoDB codebase into a cleaner, modular structure with REST API layers.
- Implemented and maintained Paystack webhook handlers for payment event processing, ensuring reliable, idempotent updates to transaction records.
- Mentored 2 backend developers, reviewed code, and owned core business logic to maintain consistency across the codebase.
- Authored backend developer documentation and introduced engineering practices that improved maintainability and security posture.

Backend Engineer — VocIntervue (AI Interview Prep Platform)

August 2026 • Volunteer

- Integrated the Deepgram speech-to-text API to power real-time voice interviews, enabling accurate transcription for downstream AI evaluation.
- Structured and processed interview transcript data for consumption by the platform's AI feedback and scoring pipeline.
- Built the subscription and entitlement system end-to-end in 2 weeks using NestJS and PostgreSQL and integrated it across core application modules.
- Co-designed backend architecture with the founding team, shaping data models and service boundaries.
- Set up backend infrastructure supporting the subscription system's launch.

SELECTED PROJECTS

Nombalens — DevCareer x Nomba Hackathon — Next.js • Node.js • TypeScript

2026

- Built a monorepo containing a Next.js dashboard, Node.js backend, and embeddable widget for payment optimisation.
- Built a smart payment-method suggestion feature where the widget calls the backend to rank a customer's last 20 transactions by payment-method frequency.

- Built a no-code split-payment configurator allowing merchants to assign revenue percentages across Nomba sub-accounts, with backend logic automatically injecting split configuration into checkout orders.
- Built real-time conversion analytics covering orders, completed payments, abandoned checkouts, and recovered revenue.

Aby-Gadgets — Fullstack E-commerce Platform — Node.js • PostgreSQL • React • TypeScript 2025

- Built REST APIs for authentication, product management, and order workflows.
- Implemented role-based access control for admin and customer routes and developed the product catalogue and cart experience.

Towello — Bayse Africa Hackathon — Team Lead • Backend Architecture & API Development 2026

- Owned backend architecture and API development while designing the overall product architecture.
- Collaborated with a fast-paced team to prototype and deploy a real-world solution within 48 hours.

EDUCATION

Diploma in Backend Development — AltSchool Africa | 2024 – 2025

ADDITIONAL

Open to remote backend engineering opportunities. Strong interest in building reliable REST APIs, relational-database-driven services, third-party/webhook integrations, and scalable fintech infrastructure.
